

What is the power sector fuel mix in Myanmar?

Hydro and natural gas dominated the power sector fuel mix in Myanmar (Figure 12.4). In 2015, the share of hydro in the power generation mix reached 58.9%, while that of natural gas was 40.8%. The remaining fuel (coal and oil) accounted for only 0.3% of the total generation mix. BAU = Business-As-Usual, TWh = terawatt-hour. Source: Study outcome.

What is happening in Myanmar's power sector?

Myanmar's power sector has been severely affected by the ongoing political turmoil. The power sector has been spiralling downwards since 2021 with prolonged electricity blackouts throughout the country. Electricity generation has been declining, resulting in a widening power supply-demand gap.

Will increasing imports help ease the electricity supply shortages in Myanmar?

While increasing imports could help to ease the electricity supply shortages in Myanmar, it remains challenging under the current circumstances. Improving power sector financial viability and recovering customer confidence are critical for private sector capital mobilization to enhance the quality of electricity services.

What fuels are used to generate electricity in Myanmar?

Hydro and natural gas dominated electricity generation in Myanmar. Other fuels such as oil and coal also contributed to the country's generation mix but was only less than 13% in total in 1990. The government's plan is to increase further the share of natural gas, coal, hydro, and other renewables in the total generation mix and decrease oil share.

Is there a reliable assessment of current and future electricity demand in Myanmar?

Currently, there is no robust and credible assessment of current and future electricity demand in Myanmar.

Does Myanmar have a power supply gap?

Myanmar's power sector will likely continue to experience significant challenges. To sustain the current level of power supply would require adding 300-500 MW every year until 2030. Scenario analysis on the power supply-demand gap illustrates that available generating capacity is projected to not meet the growing demand.

SDG Indicator Baseline Report for Myanmar -1 - Foreword from Ministry of Planning and Finance As all of us are aware, Post 2015 Development Agenda and ... report compiles and presents the data that is currently available in Myanmar's National Statistical System to monitor the Sustainable Development Goals. Data producers across government have

Myanmar's total primary energy supply was 19.8 million tons of oil equivalent (Mtoe) in 2015. Natural gas is mainly used to generate electricity and in industry. Currently, Myanmar has 5,235 megawatts (MW) of installed generation capacity and produced almost 16 terawatt-hours (TWh) of electricity in 2015 (Table 12.1). During the same
