

Are microgrids a threat to protection systems?

While microgrids have many benefits for power systems, they cause many challenges, especially in protection systems. This paper presents a comprehensive review of protection systems with the penetration of microgrids in the distribution network.

Can a microgrid protect a power system?

Protection systems need to be reviewed to consider the integration of distributed generation technologies. The presence of a microgrid causes many challenges in the protection of the power system. This study addressed these challenges and their solutions.

How to protect a microgrid with a communication network?

References [42,44] proposed the protection of a microgrid with a communication network using digital relays. These methods use differential protection for low fault currents, such as in an HIF and inverter-based-microgrid. In Reference [42], a communication-assisted OC protection scheme was proposed for PV in DC microgrids.

What types of protection systems can be used in a microgrid?

Overcurrent, directional overcurrent, distance, differential, over/under voltage, and over/under frequency relays are classical protection systems that could present an acceptable performance in the conventional power system. However, with the introduction of the microgrid, a higher number of DERs are allowed to be integrated into the grid.

How to protect microgrids using voltage measurements?

The voltage-based method is another approach to protect microgrids using voltage measurements. The method uses the voltage level gradient through the power system during faults and is often applied as a backup protection scheme [86,107].

What is Microgrid technology?

It is a small-scale power system with distributed energy resources. To realize the distributed generation potential, adopting a system where the associated loads and generation are considered as a subsystem or a microgrid is essential. In this article, a literature review is made on microgrid technology.
