What is a PTEs battery?

It is a form of a Carnot battery configuration that utilizes electrical energy input to drive a temperature difference between two reservoirs, thereby storing electrical energy in the form of thermal energy. PTES is still a developing technology and thus its efficiency is lower than that of PHES (Hydro) or CAES.

What can be used as a storage medium in PTES?

A mixture of water and rock can also be used as a storage medium in PTES. Typically, PTES systems require two elements: simple and cost-effective large storage units; and ecological, reliable, and inexpensive materials for filling, lining, and insulation.

Does Dronninglund PTES have a high storage efficiency?

For the Dronninglund PTES, storage efficiency has increased slightly yearly, peaking at 96% in 2017. The higher storage efficiency, when compared to Marstal and Gram, is partly attributable to the storage cycle, which is defined as the ratio of the discharged heat to the maximum heat capacity of PTES.

Do PTES need to be insulated?

The side and bottom walls of PTES are rarely insulated because the surrounding soil can act as a heat reservoir and transfer heat back to the PTES during discharge. However, insulation of the bottom wall is still recommended when it is closed to groundwater.

What is the storage cycle of Dronninglund PTES?

As demonstrated in Fig. 27, Marstal and Gram have storage cycles lower than 1, while the typical storage cycle for the Dronninglund PTES is 2. In addition, the proper operation of the Dronninglund project lowers the minimum PTES temperature to approximately 10 °C, reducing the heat losses from the side and bottom walls.

How efficient is a PTES system?

Among all the investigated PTES systems, the predicted roundtrip efficiency reached a (highest) value of 68%, which was similar to other TMES systems but slightly lower than large-scale PHS, VRB flow batteries and Li-ion batteries.

For the Dronninglund PTES, the five-year average storage cycle reached 2.16, resulting in a higher storage efficiency of 90.1%. Since 2015 was the second operation year, the soil around the PTES was gradually heated up by the PTES. After 2016, the storage cycle becomes the dominant factor on storage efficiency.

Among numerous PTES systems, Brayton PTES systems exhibit high efficiency and energy density, making it the most suitable for engineering applications [13,16] The Brayton PTES consists of the Brayton heat pump and the Brayton heat engine. The Brayton heat pump compresses the working fluid to high temperature during the energy storage process.
