Bionic Power's PowerWalk generates an average of 12 Watts of power from walking on mixed terrain. The harvested power can be used to recharge batteries in the field. Company is private, with funding from angels and customers. Canadian Military, U.S Army, and DARPA have invested in the product development.

The Agilik is intended for forward walking on level surfaces when the power is turned on, not for sports or aggressive use. The Agilik is indicated for patients who exhibit knee instability in the sagittal plane while bearing weight during the stance phase of their gait cycle.

Bionic Power Inc. is a Canadian, privately held company that has developed and holds IP rights on wearable technology. This technology addresses the rapidly growing market for mobility assistance in patients with knee pathologies.

The Agilik smart orthosis helps people with knee-related gait deficiencies gain endurance and independence. Those with flex knee gait (typically associated with Cerebral Palsy and Spina Bifida) are lifted out of crouch and those with lower limb hemiparesis (post-polio, for example) receive assistance for both extending and flexing their knee.

Bionic Power designs and develops lower body smart orthotic devices that enhance walking abilities for children and adults with neuromuscular diseases and conditions, including cerebral palsy, spina bifida, and stroke.
