How is distributed generation changing the energy landscape in Brazil?

Brazil is experiencing a transformative moment in the way it produces and consumes energy. Distributed generation (DG) is changing the energy landscape in the country, creating new opportunities for investments and partnerships, and presenting challenges in the search for sustainability and energy efficiency.

Why is the Brazilian distributed generation industry growing so fast?

Abstract The Brazilian distributed generation ("DG") industry has been growing quickly since 2015, driven by proper regulations (including net metering regulations), financing availability and technological developments, in addition to the natural incentive for electricity cost reduction.

How has photovoltaic power grown in Brazil?

The most recent data show an impressive growth of DG in Brazil. Since 2013, photovoltaic DG has grown at an average rate of 230% per year. In 2019, the country had 1 GW of installed DG power, which doubled to 2 GW in January 2020 and reached 3 GW in June of the same year.

How much power does Brazil have in 2022?

In 2022, Brazil surpassed the mark of 10 GW of installed power in distributed micro and mini-generation, enough to supply approximately 5 million Brazilian residential units, that is, to serve almost 20 million people. By the end of May 2023, DG reached the mark of 11 GW of installed power.

How many DG projects are there in Brazil?

Based on information available at ANEEL's website, there are 338,990 operational DG projects that added 4.3 GW of installed capacity. This represents approximately only 2 percent of the total installed capacity in Brazil. In comparison, China has approximately 50 GW and the United States 20 GW of DG installed capacity.

Which regulations apply to all utilities in Brazil?

These regulations apply to all utilities in the country as they are subject to Federal regulations issued by the Brazilian Electricity Regulatory Agency ("ANEEL"). DG is specifically regulated by ANEEL's Normative Resolution No. 482/2012, as amended by Normative Resolutions No. 517/2012, 687/2015 and No. 786/2017 ("REN 482/2012").

Hydroelectric power on a residential scale. It is well known that energy is generated by building dams over giant underwater turbines; however it is possible to use micro hydro generators (<100kW) or pico hydro generators (<5kW) on more modest water flows.

convert the power available is less than 100 percent efficient. To calculate the realistic power output from your site, you must take into account the friction losses in the penstock pipes and the efficiency of the turbine and generator; this is the efficiency factor (e).
