This new energy storage device used highly-reversible charge storage in the electric double layer of a high-surface-area carbon, which provided unheard of capacitance density with essentially unlimited charge/discharge cycle life.

The energy-storage performance of a capacitor is determined by its polarization-electric field (P-E) loop; the recoverable energy density  $U_e$  and efficiency  $\eta$  can be calculated as follows:  $U_e = \int P_r P_m E dP$ ,  $\eta = U_e / (U_e + U_{loss})$ , where  $P_m$ ,  $P_r$ , and  $U_{loss}$  are maximum polarization, remnant polarization, and energy loss, respectively ...
