

Design of Microgrid Protection System

How to design a microgrid protection system?

Some of the major points to address in the design of the protection schemes for microgrids are: (1) DER with high penetration level and islanded operation mode; (2) the protection system must be adequate for configuration changes; and (3) the architecture of the protection system.

What are the challenges of microgrid protection?

The main challenge of protecting a microgrid comes from the significant difference between short-circuit currents in both operation modes. The changes on microgrid topology and the variability on DER generation create big problems on protection systems. The microgrid protection system must respond to internal and external faults.

Does microgrid deployment require a control system and a protection system?

Abstract: Microgrid deployment requires a microgrid control system and a microgrid protection system. The design of both systems needs to consider the nature of the microgrid assets, which may include a significant amount of distributed energy resources, and the modes of operation, either grid-connected or islanded modes.

What is a microgrid adaptive protection system?

An adaptive protection system should protect a whole microgrid in all operating conditions. Therefore, the proper operation of the IED protection and control functions require real-time data like the microgrid topological information, generators on or off, status of storage systems, and the number and size of loads connected in the microgrid.

What are the solutions for dc microgrid protection?

Solutions for DC microgrid protection DC microgrid system requires a protection scheme which improves the overall performance of the DC distribution system. The various protection strategies are embellished in Table 6.

What is a microgrid protection scheme?

The protection schemes try to provide an appropriate protection strategy which can protect microgrids in both grid-connected and islanded modes. In general, it can be identified solutions based on simple protection functions supported using Intelligent Electronic Devices (IED) with communications.
