

How many power plants are there in Brazil?

Nowadays in Brazil, there are about 250 isolated systems, concentrated in the Northern region, which sums only 1% of the electricity total consumption of the country, but represents around 40% of the territory. Most of these systems are supplied by diesel power plants, with a few examples of generation by natural gas, biomass or small-hydro.

Are renewables cost effective in Brazilian isolated systems?

Diesel is the main source for electricity generation in Brazilian isolated systems. Many studies suggest that renewables are already cost effective in these systems. Six public policies are proposed to promote renewables in isolated systems. An MCDM model (AHP-fuzzy-TOPSIS) is developed to evaluate the policies.

How does Brazil's energy system affect the environment?

As discussed, the majority of isolated systems in Brazil are located inside the Amazon forest and the electricity generation on these places is mostly based on burning fossil fuel, leading not only to greenhouse gas emissions and pollution in a sensitive area, but also to expensive costs.

What do you like about energy systems?

So what I like about Energy Systems is that they are very professional and were supportive all along the way with our project. They know what to ask in order to deliver the best solution for our needs, and not just for selling purposes - you can really trust this supplier.

A empresa ENERGY SYSTEMS DO BRASIL LTDA tem CNPJ 17873774000120 e sede em Osasco, SP. Sua atividade principal é Comércio varejista de outros produtos não especificados anteriormente de acordo com o CNAE de código G-4789-0/99.

We are proudly making batteries in Brazil since 2002 and expanded our operations to a larger site in 2018 in Bonsucesso - Guarulhos. The plant produces heavy-duty and reliable tubular plates lead-acid batteries for material handling equipment and energy storage systems.

VedantaESS will utilise EnerVenue's ESVs to service Brazil's growing demand for clean energy, including via distributed generation, isolated microgrids, and commercial, industrial, and utility applications.

Concentrated in the northern region of Brazil, the country's 250 isolated systems represent around 1% of the national energy consumption and have been historically supplied by diesel power plants, an expensive solution that relies on complicated logistics and is responsible for high GHG emissions.

Brazil's per capita energy consumption is expected to increase by 18 per cent from 2019 to 2029. The country is already procuring a large share of its electricity from renewable energy sources. Of these, 60 per cent is

## Energy systems ltd Brazil

derived from hydroelectric power, while 20 per cent originates from other sources such as wind, biomass and photovoltaics.

energies, such as solar and wind, and energy efficiency are important for Brazil. It is estimated that, by 2029, there will be an a growth of 25 GW in installed capacity of wind energy, representing an increase of 163%, compared to the year 2019 (15 GW). For centralized solar energy, the expectation is even greater: increase

Our team is committed to provide best experience for our customers, producing solutions and using our global experience to bring technology and innovation to them. We have people with years of experience in energy systems project development and a great pole to bring new people to train and transfer the knowledge.
