Does a crack in a photovoltaic module affect power generation?

This paper demonstrates a statistical analysis approach, which uses T-test and F-test for identifying whether the crack has significant impact on the total amount of power generated by the photovoltaic (PV) modules. Electroluminescence (EL) measurements were performed for scanning possible faults in the examined PV modules.

What causes cell cracks in photovoltaic panels?

Cell cracks appear in the photovoltaic (PV) panels during their transportation from the factory to the place of installation. Moreover, some climate proceedings such as snow loads, strong winds and hailstorms might create some major cracks on the PV modules surface [ - ].

How a crack in a PV cell affect the output power?

Diagonal cracks and multiple directions cracks always show a significant reduction in the PV output power . Moreover, the PV industry has reacted to the in-line non-destructive cracks by developing new techniques of crack detection such as resonance ultrasonic vibration (RUV) for screening PV cells with pre-existing cracks .

Do PV modules have cracks?

Before examining the cracks in the PV modules, a real time long-term data measurements are taken to compare the output power performance of the PV modules versus the theoretical predictions simulated using LabVIEW software. This test was made to investigate the degradation level of the power in each PV module separately.

Does PV crack affect output power performance?

A statistical analysis approach is used to determine whether the PV crack has a significant impact on the total generated output power performance or not. Two statistical methods are used, T-test and F-test. The first method (T-test) is used to compare the simulated theoretical power with the measured PV output power.

Do micro cracks affect PV output power?

The experiment was carried out on ten different PV modules installed at the University of Huddersfield, United Kingdom. The examined PV modules which contain micro cracks shows large loss in the output power comparing with the theoretical output power predictions, where the maximum power loss is equal to 80.73%.
