What temperature should a lithium battery be stored?

Proper storage of lithium batteries is crucial for preserving their performance and extending their lifespan. When not in use, experts recommend storing lithium batteries within a temperature range of  $-20^{\circ}\text{C}$  to  $25^{\circ}\text{C}$  ( $-4^{\circ}\text{F}$  to  $77^{\circ}\text{F}$ ). Storing batteries within this range helps maintain their capacity and minimizes self-discharge rates.

What happens if you charge a lithium battery at high temperatures?

Charging lithium batteries at extreme temperatures can harm their health and performance. At low temperatures, charging efficiency decreases, leading to slower charging times and reduced capacity. High temperatures during charging can cause the battery to overheat, leading to thermal runaway and safety hazards.

What are environmental control measures for lithium batteries?

Environmental control measures involve controlling the temperature of the surroundings where lithium batteries are used or stored. This includes maintaining ambient temperatures within the optimal range of  $15^{\circ}\text{C}$  to  $35^{\circ}\text{C}$  ( $59^{\circ}\text{F}$  to  $95^{\circ}\text{F}$ ). Avoid exposing batteries to extreme temperatures, such as in hot cars or direct sunlight.

What is a thermal management system in a lithium battery?

Thermal management systems help regulate the temperature of lithium batteries during operation. Typical systems include heat sinks, cooling fans, thermal pads, and temperature sensors. Heat sinks dissipate excess heat from the battery to prevent overheating. Cooling fans improve airflow around the battery, aiding in heat dissipation.

How do you protect batteries from temperature fluctuations?

Avoid leaving batteries in vehicles exposed to direct sunlight, as temperatures inside can exceed safe limits. During transport in extreme climates, insulated packaging or temperature-controlled containers can protect batteries from temperature fluctuations.

What happens if a lithium battery is cold?

In cold temperatures, like below  $15^{\circ}\text{C}$  ( $59^{\circ}\text{F}$ ), lithium batteries experience reduced performance. Chemical reactions within the battery slow down, causing decreased power output. Shorter battery life and diminished capacity result from these conditions. Devices may shut down unexpectedly in extreme cold due to reduced battery efficiency.

In fact, Li-ion battery fires are classed as flammable liquid fires, Class B. Li-ion battery fires can also reignite themselves, as  $\text{Li} +$  can self-oxidise, making them difficult to put out.
