What is a microgrid MATLAB & Simulink?

Microgrid network connected to a utility grid developed in the Simulink environment. With MATLAB and Simulink, you can design, analyze, and simulate microgrid control systems. Using a large library of functions, algorithms, and apps, you can:

How do you develop a microgrid control system?

Design a microgrid control network with energy sources such as traditional generation, renewable energy, and energy storage. Model inverter-based resources. Develop microgrid control algorithms and energy management systems. Assess interoperability with a utility grid. Analyze and forecast load to reduce operational uncertainty.

What is a microgrid control mode?

Microgrid control modes can be designed and simulated with MATLAB[®], Simulink[®], and Simscape Electrical[™], including energy source modeling, power converters, control algorithms, power compensation, grid connection, battery management systems, and load forecasting. Microgrid network connected to a utility grid developed in the Simulink environment.

How does a microgrid work?

A microgrid can operate when connected to a utility grid (grid-connected mode) or independently of the utility grid (standalone or islanded mode). In islanded mode, the system load is served only from the microgrid generation units. In this mode, the microgrid control regulates voltage and frequency of generation units using grid-forming control.

What is droop control in a microgrid?

The example illustrates the operation of an inverter-based microgrid disconnected from the main grid (islanded mode), using the droop control technique. The U.S. Department of Energy defines a microgrid as a local energy grid with control capability, which means it can disconnect from the traditional grid and operate autonomously.

What is a microgrid central controller?

Each of the individual resources and controllable loads needs a controller. These controllers are referred to as local or resource controllers. In addition, a microgrid central controller (MGCC) is needed to act as a coordinator/supervisor to the local controllers (LCs).
