The 66 kWh single-pack battery offers abundant power in a one-piece, low-profile design. For compact and flexible installations, GM designed modular versions providing 48 kWh of available power that can be stacked or placed side by side.

Large electric vehicles, such as buses and trucks, use standardized battery packs, such as the C pack and the G pack. This article will discuss these packs in more detail. Did you know that the actual nominal voltage of a LFP cell is 3.22V? This is the nominal voltage for its standard C rate of charge and discharge.

As the pack size increases the rate at which it will be charged and discharged will increase. In order to manage and limit the maximum current the battery pack voltage will increase. When we plot the nominal battery voltage versus pack total energy content we can see the voltage increasing in steps. Typical nominal voltages: 3.6V; 12V; 48V ...

Example - To achieve a battery nominal voltage of close to 650V using 230Ah cells, one would connect one C pack with four G packs. System Voltage = C Pack + 4*G Packs = 48S + 4*39S = 204S = 204*3.22V = 656.88V. Similarly, different combinations of C pack and G pack can be connected in series to achieve the desired voltage as per the cell used.
