The components of the IBM Elastic Storage Server (ESS) for Power are described as follows: . The Elastic Storage Server is a high-performance, GPFS(TM) network shared disk (NSD) solution that is made up of one or more building blocks. A building block is a pair of servers with shared disk enclosures attached. See Building-block configurations for more information.

IBM Elastic Storage Server (ESS) uses Reed-Solomon codes or N-way replication to protect data integrity when the physical disk fail. In addition, ESS has the ability to detect disk location. ESS can place data strips across disks that belong to different locations. This function gives ESS a higher fault tolerance, which is known as disk failure ...

This edition applies to IBM Elastic Storage Server (ESS) version 5.3.4, which is based on IBM Spectrum Scale 5.0.3. Note: Before using this information and the product it supports, read the ...

This IBM Redpaper publication provides an overview of the IBM Elastic Storage Server (IBM ESS) and IBM Elastic Storage System (also IBM ESS). These scalable, high-performance data and file management ...

This IBM Redbooks publication introduces and describes the IBM Elastic Storage Server 3500 (ESS 3500) as a scalable, high-performance data and file management solution. The solution is built on proven IBM Storage Scale technology, formerly IBM ...

This IBM Redbooks publication introduces and describes the IBM Elastic Storage Server 3200 (ESS 3200) as a scalable, high-performance data and file management solution. The solution is built on proven IBM Spectrum Scale technology, formerly IBM General Parallel File System (IBM GPFS).

IBM Elastic Storage Server (ESS) building block is typically composed of two recovery group servers (aka I/O servers) and several JBOD enclosures depending on the ESS models. Each enclosure is twin-tailed connected to both I/O servers with SAS cables for redundancy. Typically, ESS building block is divided into two recovery groups evenly, i.e ...
