

Why is power quality important in a microgrid?

Power quality has become a significant matter for electric utilities and is nowadays acquiring a lot of interest. A microgrid (MG) is a single powerful entity with many loads and distributed generators embedded in it. For high power output in MG, a specific standard has to be met, which can be possible if we address the PQ issues properly.

Can wind and solar microgrids improve power quality in smart mg?

o Power sharing and power quality improvement in smart MG through an artificial intelligence-based Icos f control algorithm. o To strengthen the central grid and enhance power quality, this study gives a thorough study of the integration of wind and solar microgrids with the grid for dynamic power flow control.

What are the solutions to power quality issues in microgrid networks?

Solutions to power quality issues which can be implemented in single-phase microgrid networks include: elimination of reactive power exchange between DG units [ 19, 29, 44 - 54 ]; regulation of voltage and frequency fluctuations [ 19, 29, 44 - 54 ]; and mitigation of current and voltage harmonics [ 1, 55, 56 ].

Can a single-phase microgrid improve power quality?

The comparison is performed with respect to the ability of the method/device in improving the following power quality issues when applied to single-phase microgrids: reduce/eliminate voltage and frequency fluctuations; reduce/eliminate the reactive power exchange between DG units, and reduce/eliminate the current and voltage harmonic distortions.

Can DRL agent improve microgrid power quality?

The presented system is designed to enhance microgrid power quality by using DRL agent for autonomous learning and control optimization, negating the need for predefined mathematical models. Moreover, for DC-link voltage control, a robust GOA-tuned PI controller is also proposed in this study.

Why are voltage and current harmonics important in microgrids?

Voltage and current harmonics are an important power quality concern in single-phase microgrids. Harmonic distortion increases the power losses and may cause stability problems particularly in islanded microgrids. Current harmonics can be injected by the DG units due to poorly designed control loops.

The MG is an electronic control structure in the power industry. It is a collection of several Distributed Generation (DG) sources synchronized to supply the electricity in high-load situations in both an isolated and a grid-tied mode of operation (Choudhury, 2020a). MG when integrated close to the high load centres satisfies the power system's quality, reliability, ...
