

What are the requirements for a vacuum flat plate solar collector?

1. The induced stress on glass surface above a support pillar in a vacuum flat plate solar collector must not exceed 4 MPa for annealed glass and 35 MPa for tempered glass. By taking this criterion into consideration in the design of the pillar specification, glass failure can be prevented over the service life of the collector. 2.

Can a flat plate collector reduce convective heat loss?

A flat plate collector for high efficiency at medium temperatures (70-120 °C) was proposed (Beikircher et al., 2015) where multiple transparent glass panes were used to divide the space between the cover glass and the solar absorber to minimise convective heat losses.
