

Solar power generation system connected to mains electricity

Why should a solar PV system be connected to the grid?

For financial benefit. Connecting your solar PV system to the grid allows you to take advantage of the FIT, which gives you a fixed amount of money for each kWh of electricity you generate. On top of these payments for energy generation, you also receive a sum of money for feeding any surplus energy into the grid.

How does a solar power system work?

Depending on your chosen setup, you may have to connect the solar battery and inverter to your circuit breaker panel and fuse box to run into the home. Each connection in the breaker box will connect to different sections of your home, allowing you to send power from the solar power system into your entire house.

Do solar panels generate electricity?

That said, the rate at which solar panels generate electricity varies depending on the amount of direct sunlight and the quality, size, number and location of panels in use. Even in winter, solar panel technology is still effective; at one point in February 2022, solar was providing more than 20% of the UK's electricity.¹

How does a solar PV system work?

As shown in Fig 1, the PV system incorporates a number of PV modules which convert the energy of solar radiation emitted by the sun into electrical energy by means of the photovoltaic effect. The modules are connected into series 'strings' to provide the required output voltage and arranged into one or more arrays.
