

# Solution to poor power supply in Palestine

How can Palestine reduce its reliance on imported energy carriers?

Palestine can reduce reliance on imported energy carriers by deployment of clean energy systems, especially solar, geothermal and biomass. Palestinian areas have large alternative energy potential which can be harnessed by a futuristic energy policy, large-scale investments and strategic assistance from neighbouring countries like Jordan and Egypt.

Can the environment around the Palestinian territories help solve the energy crisis?

The environment around the Palestinian territories could potentially hold the key to mitigating the existing energy crisis, as well as reduce Palestine's energy dependency on its neighbors and bolstering the economic viability of Palestine as a more self-sufficient nation.

What are the challenges facing Palestine's energy supply?

Political instability, population booms, rapid industrialization and increasing demand for higher living standards have put tremendous stress on Palestine's energy supply.

Can solar energy help alleviate poverty in Palestine?

Several groups and NGOs have already paved the way for the broader use of solar energy in Palestine. Sunshine4Palestine is a great example of how a group can utilize solar energy to help alleviate symptoms of poverty.

Is Israel a viable solution to Palestine's energy crisis?

Palestine has a significant dependence on Israel and neighboring Jordan and Egypt for the majority of its energy demands. However, this system is not viable as a long-term solution.

Why is energy demand so high in the Palestinian territories?

Energy demand in the Palestinian territories is growing rapidly while the availability of natural resources is scarce, making the power sector almost entirely dependent on energy imports from neighboring countries.

The Palestinian power sector is entirely dependent on imported power supply, 88% from Israel and 3% from Jordan and Egypt. Egypt supplies merely 17MW of electrical power to the Gaza Strip while 20MW is supplied to Jericho by Jordan's state-utility firm.

Because of the unpredictability of the power supply, some Gazans and government institutions use private electric generators, solar panels and uninterruptible power supply units to produce power when regular power is not available.

Such efforts require political will and advocacy at the national and international levels, especially as part of a

Such efforts require political will and advocacy at the national and international levels, especially as part of a dialogue that aims at maximum use of available un-accessed lands or the roofs of existing buildings. This solution would provide a model for scattered electricity generation.

With a unique set of critical energy challenges, Palestine is an ideal environment for off-grid renewable energy and boasts many initiatives and projects, large and small, which are either in the planning stages or operational.

More incentives and fiscal mechanisms are needed to be devised in Palestine, especially for small and medium power RE systems. There is a need to develop strategies, policies, and action plans of RE utilization for heating and cooling applications, especially for residential buildings.

OverviewElectricity generationPetroleumElectricity importsElectricity transmissionElectricity distributionHistoryDebt to IECSIn 1999, Palestine Electric Company (PEC) was formed in the Palestinian territories as a subsidiary of Palestine Power Company LLC to establish electricity generating plants in territories under PA control. In 2010, PADICO Holdings, PEC and other Palestinian companies formed the Palestine Power Generation Company (PPGC) to build power plants in areas under PA control, and to reduce P...

Through conducting interviews and meetings with relevant institutions and specialists, four main pillars of the electricity sector were identified: energy sector management and governance, energy supply, energy demand, and sustainability.

Unlocking the potential of renewable energy in Palestine will help alleviate the growing carbon footprint of areas like Gaza, as well as fill holes in the already strained power grids that support Gaza and the West Bank.

To enable marginalized communities in Palestine to access electricity at a lower price, the pilot worked with Local Government Units (LGUs) to identify the most suitable communities that would benefit from grid rehabilitation activities and solar power plant installation.

The available power capacity does not meet the demand in all Palestinian areas. Lack of electricity and the high cost of imported electric power are the main factors in the low Palestinian consumption of electric power.

## **Solution to poor power supply in Palestine**

In Palestine, renewable and sustainable energy technologies can play a key role in facing shortage of energy supplies in Palestine due to its trustworthiness and safety (Salah and Abuhelwa, 2020).
