The electric charge of one electron is equal in magnitude and opposite in sign to the charge of one proton. An ion is an atom or molecule that has nonzero total charge due to having unequal numbers of electrons and protons. The SI unit for charge is the coulomb (C), with protons and electrons having charges of opposite sign but equal magnitude ...

Batteries Part 1 - As Energy Storage Devices. Batteries are energy storage devices which supply an electric current. Electrical and electronic circuits only work because an electrical current flows around them, and as we have seen previously, an electrical current is the flow of electric charges (Q) around a closed circuit in the form of negatively charged free electrons.

There are several places where you can charge your electric vehicle: Home charging: You can charge your electric vehicle at home using a Level 1 or Level 2 charger. Level 1 chargers can be plugged into a standard

where  $F_e$  is the electric force,  $q_1$  and  $q_2$  are electric charges,  $k$  is the Coulomb's constant  $8.988 \times 10^9 \text{ N}\cdot\text{m}^2/\text{C}^2$  and  $r$  is the distance of separation. By applying Coulomb's Law, we can quantitatively determine the strength of the electric force between charges and gain valuable insights into their interactions.

This means that electric charge comes in discrete amounts, and there is a smallest possible amount of charge that an object can have. In the SI system, this smallest amount is ( $e$  equiv  $1.602 \times 10^{-19}$ , C). No free particle can have less charge than this, and, therefore, the charge on any object--the charge on all objects--must be ...
