

Should solar panels be arranged in the shape of a tree?

The strategy of arranging solar panels in the shape of a tree has proved to be an interesting alternative for the generation of photovoltaic solar energy when restrictions are mainly due to the scarcity of area rather than the cost of the system.

How do Solar Trees reduce solar irradiation?

The solar tree has multiple solar module layers, which leads to shading of solar irradiation to another layer and loss efficiency. Many designers and researchers have been looking for a new structure to construct the branches and solar modules to prevent or decrease the shading of each other.

What is a photovoltaic solar tree?

The photovoltaic solar tree is an alternative to increase the efficiency of photovoltaic systems by optimizing inclination angles and reducing the occupied area. A solar tree design usually aims to maximize the electrical energy generation in a given area whereas the traditional solar photovoltaic system aims to minimize the energy cost generated.

What are the advantages of a photovoltaic solar tree?

The main advantage of a photovoltaic solar tree, when compared to photovoltaic systems with single orientation panels, is the possibility of optimizing the orientation of each solar panel. This characteristic may allow the energy generation to be optimized in desired periods.

How many solar panels does a solar tree have?

What can the space under solar trees be used for?

Finally, the multiple uses of the space under the solar trees were reviewed, considering the photovoltaic energy generation and other goals. The space under the solar tree panels can be used for various purposes, such as crop production, leisure and shaded parking lots.
